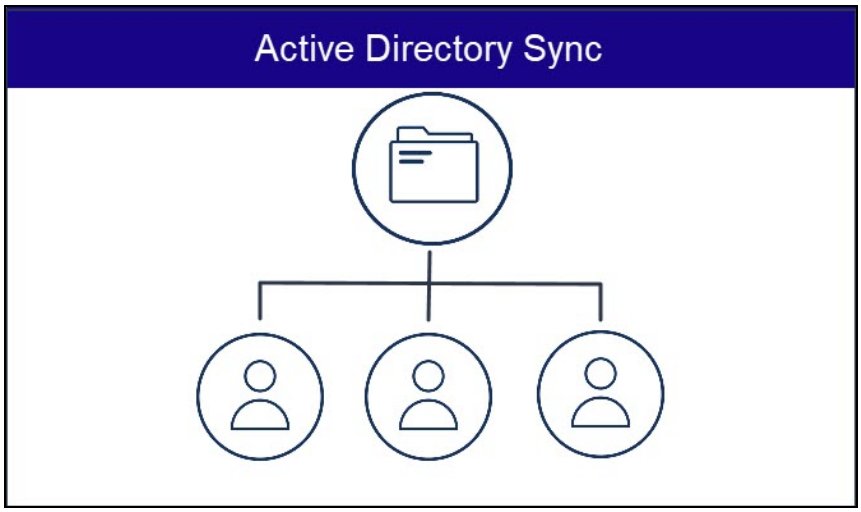
# What's New in Mitel Revolution 2019.4

This document describes the new features and functionality now available in the latest release of Mitel Revolution 2019.4.

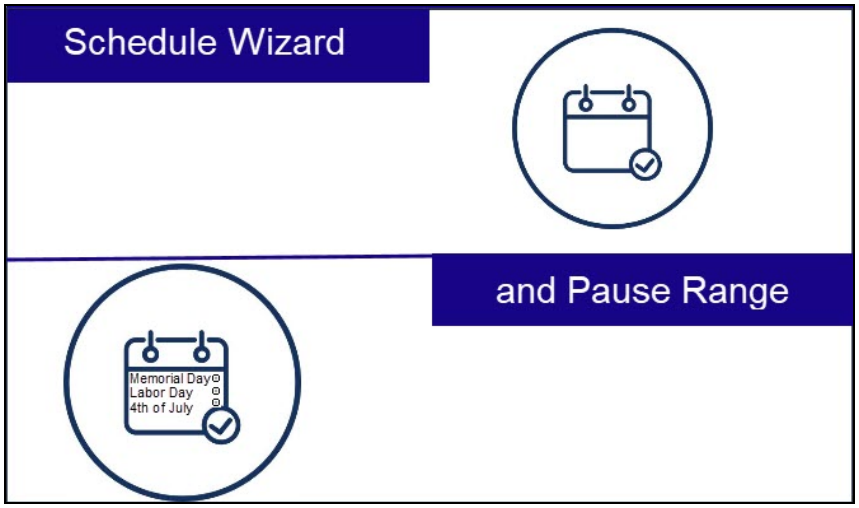
## Active Directory Sync

Revolution now automatically updates Contacts and Users imported from Active Directory on a timed schedule. This allows system admins to spend less time updating their servers and more time addressing situations at-hand — giving you peace of mind knowing your recipient's contact information is kept up to date. *See the Mitel Revolution Web Help for more details*.



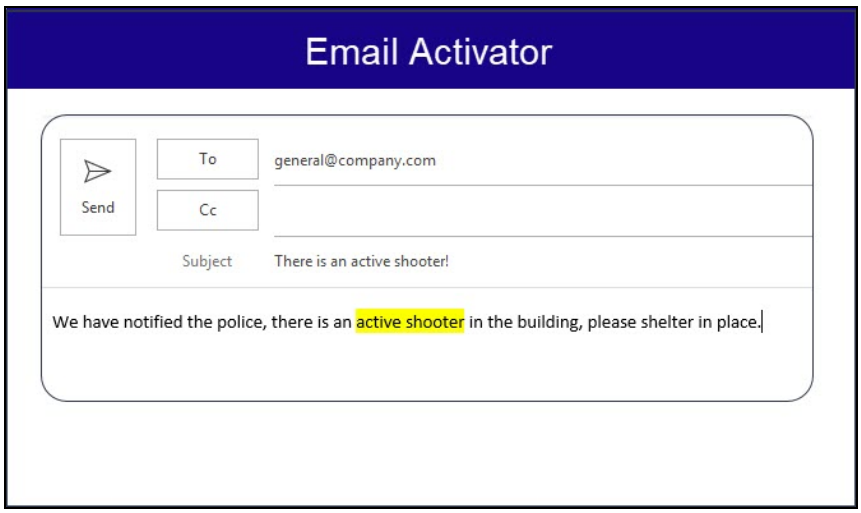
## Scheduler Wizard

We've enhanced Revolution's Scheduler. In this release, customers can create an entire event schedule using the wizard tool. Setting up your school bells, shift schedules, and other repeating alerts can now be configured to repeat a pattern of day templates on a weekly or multi-weekly pattern. You can also specify ranges of time that you'd like to pause your scheduled events *(which is useful for holiday breaks in your organization)*.



## Email Activator

Mitel Revolution's Email Activator allows you to trigger notifications based on keywords or other filter criteria received to individual mailboxes. Email Activator supports Microsoft Exchange and the Internet Message Access Protocol (IMAP). You can set up filters to only trigger notifications based on certain criteria – to or from a particular email account, subject, or keyword matches in the body of the email. Email Activator also supports regular expressions for more complicated filters.



## Notable Highlights

The following are the other highlights from release 2019.4:

- **Input Stream Audio Notifications –** Users can now source audio for notifications from another system that sends a static multicast stream. You can configure your notification to play the static stream as the audio broadcast of your notification. *See the Stream Activator and Direct One-Way Notification topics in the Web Help for details.*
- **Webhook Notifier –** Revolution now supports sending HTTP requests like GET & POST to external systems. You can configure your HTTP endpoints to integrate with external HTTP services. Information from your notifications can be passed through to the external system, allowing you to extend the reach of your Revolution notifications.
- **Text & Image Overrides in the Revolution API –** Our customers have been requesting a way to override text and audio when using the Revolution API HTTP GET to activate a notification. We have updated our API to support this option in this release. *See the Revolution API specification in the Web Help for more information.*
